

Instructions for Sanitizing a 400 GAL Water Buffalo

1. Obtain 3 quarts of unscented household bleach (5% chlorine solution).
2. Fill the water trailer, with potable water, about half way.
3. Pour the 3 quarts of unscented household bleach into the water trailer.
4. Fill the water trailer, with potable water, until about 95% full.
5. Drive the water trailer around for about 10 minutes in order to mix the solution.
6. Flush all (5) taps for 30-45 seconds (ensure water does not get on clothing because the bleach concentration is high).
7. Let the water trailer sit for an additional 50 minutes, for a total contact time of 60 minutes.
8. Drain water into a sanitary sewer (normally located in a motor pool or wash rack).
9. Rinse the water container (including water spigots) twice.

NOTE: If the container will not be used within 30 days, open all spigots, drain plug and manhole cover to allow the trailer to air dry. After it is dry, close all orifices and repeat sanitation procedures stated above before use.
